Indirect Supervision from Generative and Retrieval Tasks

Indirectly Supervised Natural Language Processing (Part II)

Muhao Chen

Department of Computer Science
University of Southern California

July 2023

ACL Tutorials

Indirectly Supervised Natural Language Processing

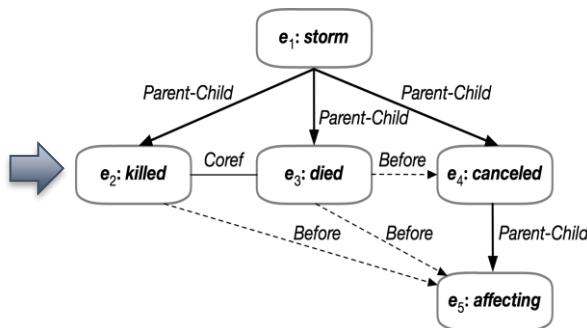

How do we support more **expensive** NLU tasks with more
resource-rich NLG/IR tasks?

The Root of All Problems: Expensive Supervision

Obtaining direct supervision can be **difficult** and **expensive**

On Tuesday, there was a typhoon-strength ($e_1:\text{storm}$) in Japan. One man got ($e_2:\text{killed}$) and thousands of people were left stranded. Police said an 81-year-old man ($e_3:\text{died}$) in central Toyama when the wind blew over a shed, trapping him underneath. Later this afternoon, with the agency warning of possible tornadoes, Japan Airlines ($e_4:\text{canceled}$) 230 domestic flights, ($e_5:\text{affecting}$) 31,600 passengers.

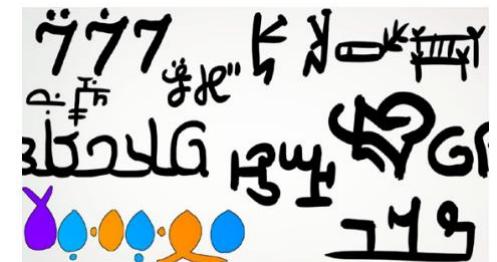

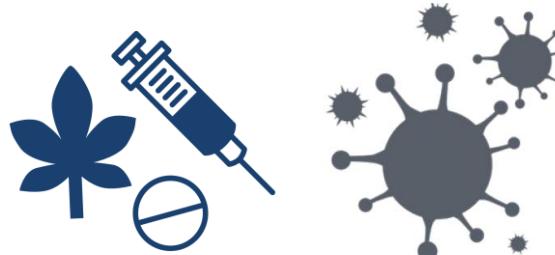

- Reading long documents, recognizing complex structures

- Costly effort from expert annotators

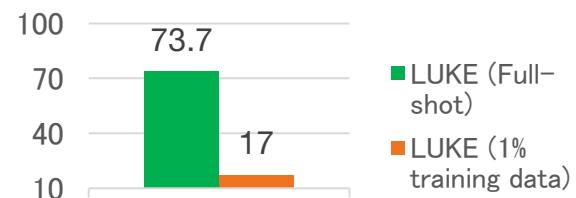

Insufficiency

- **General domain:** A few hundred documents or ten thousand scale sentences with annotation
- **Specialized domains:** Up to several thousand sentences.

Low-resource Domains with Almost No Annotations

Result: Poor Generalization

Challenge: Conditioned Decision Making

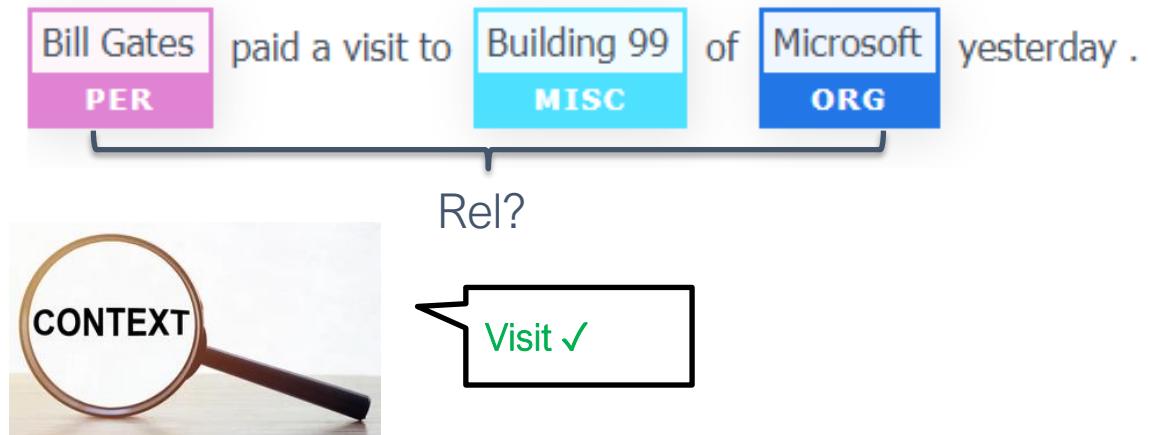

NER / Event Extraction (Conditioned on surrounding tokens)

Person p Loc l Org o Event e Date d Other z

Barack Hussein Obama II * (born August 4, 1961 *) is an American * attorney and politician who served as the 44th President of the United States * from January 20, 2009 *, to January 20, 2017 *. A member of the Democratic Party *, he was the first African American * to serve as president. He was previously a United States Senator * from Illinois * and a member of the Illinois State Senate *.

Relation Extraction (Conditioned on entity mentions)

Hard to be modeled as NLI

- Diverse preconditions in the same context (different spans, entity pairs in the same input)
- Ambiguous entailment (the same input needs to entail many hypotheses)

Challenge: Very Large Decision Spaces

Entity Linking, Fine-grained Typing

Extreme multi-label classification (XMLC)

From Wikipedia, the free encyclopedia

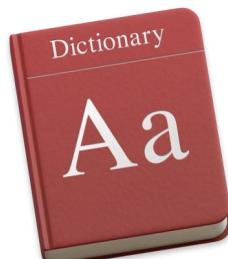

In machine learning, support-vector machines (SVMs, also support-vector networks^[1]) are supervised learning models with associated learning algorithms that analyze data for classification and regression analysis. Developed at AT&T Bell Laboratories by Vladimir Vapnik with colleagues (Boser et al., 1992; Guyon et al., 1993; Cortes and Vapnik, 1995;^[2] Vapnik et al., 1997^[citation needed]) SVMs are one of the most robust prediction methods, being based on statistical learning frameworks or VC theory proposed by Vapnik (1982, 1995) and Chervonenkis (1974). Given a set of training examples, each marked as belonging to one of two categories, an SVM training algorithm builds a model that assigns new examples to one category or the other, making it a non-probabilistic binary linear classifier (although methods such as Platt scaling exist to use SVM in a probabilistic classification setting). SVM maps training examples to points in space so as to maximise the width of the gap between the two categories. New examples are then mapped into that same space and predicted to belong to a category based on which side of the gap they fall.

In addition to performing linear classification, SVMs can efficiently perform a non-linear classification using what is called the kernel trick, implicitly mapping their inputs into high-dimensional feature spaces.

When data are unlabelled, supervised learning is not possible, and an unsupervised learning approach is required, which attempts to find natural clustering of the data to groups, and then map new data to these formed groups.

supervised learning

Tasks with **very large decision spaces** that to be supervised as NLI or classification.

Thousands to millions of labels, more like a dictionary.

Challenge: Non-discriminative Decision Making

Non-discriminative or structured decisions that are beyond the ability of NLI

Spans (Extractive QA)

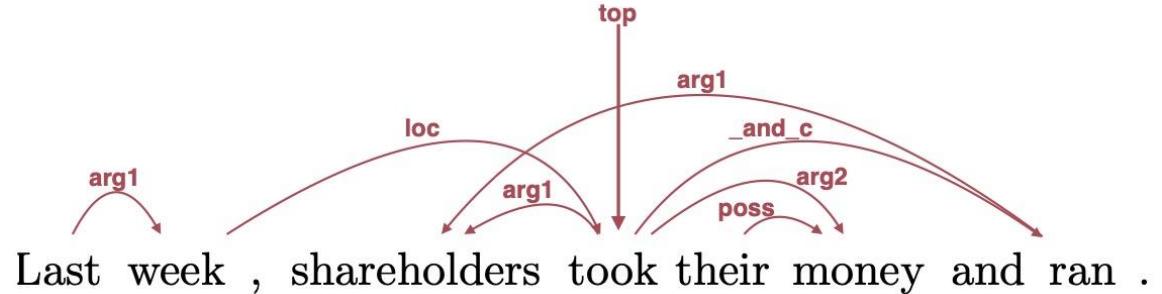

Passage Context

The Matrix is a 1999 science fiction action film written and directed by The Wachowskis, starring **Keanu Reeves, Laurence Fishburne, Carrie-Anne Moss, Hugo Weaving, and Joe Pantoliano**. It depicts a dystopian future in which reality as perceived by most humans is actually a simulated reality called "the Matrix": created by sentient machines to subdue the human population, while their bodies' heat and electrical activity are used as an energy source. Computer programmer "Neo" learns this truth and is drawn into a rebellion against the machines, which involves other people who have been freed from the "dream world."

Question

Who stars in The Matrix?

Structures (SDP)

Generation (QFS)

Query: "Describe the coal mine accidents in China and actions taken"

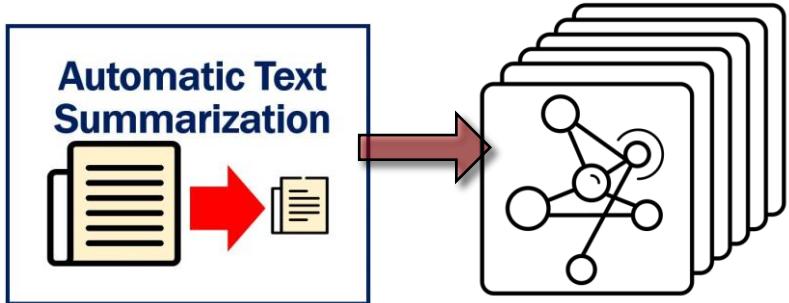

Example summary (from Li and Li 2013):

- (1) In the first eight months, the death toll of coal mine accidents across China rose 8.5 percent from the same period last year.
- (2) China will close down a number of ill-operated coal mines at the end of this month, said a work safety official here Monday.
- (3) Li Yizhong, director of the National Bureau of Production Safety Supervision and Administration, has said the collusion between mine owners and officials is to be condemned.
- (4) from January to September this year, 4,228 people were killed in 2,337 coal mine accidents.
- (5) Chen said officials who refused to register their stakes in coal mines within the required time

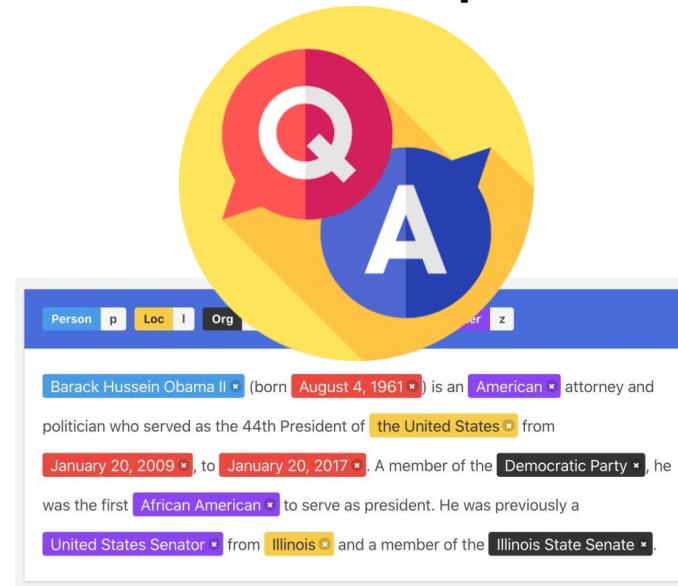

In This Talk

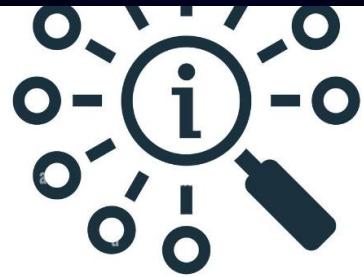

1. Constrained Generation as Indirect Supervision

2. QA as Indirect Supervision

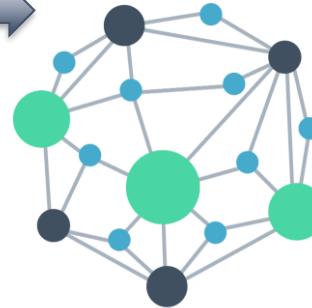

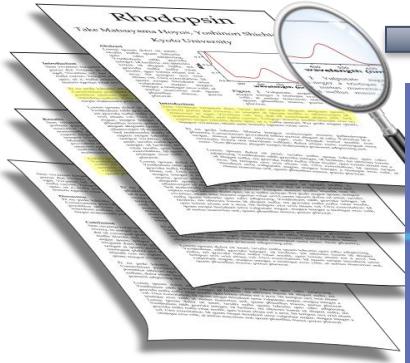

3. IR as Indirect Supervision

Insufficient Structural Annotations

Information extraction suffers from insufficient supervision

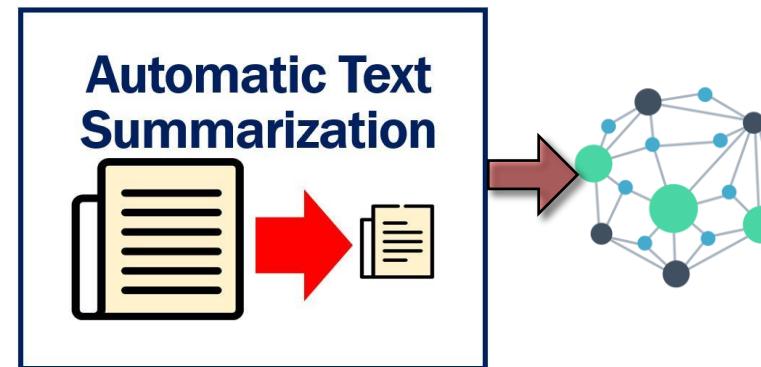

Direct annotation is difficult and expensive

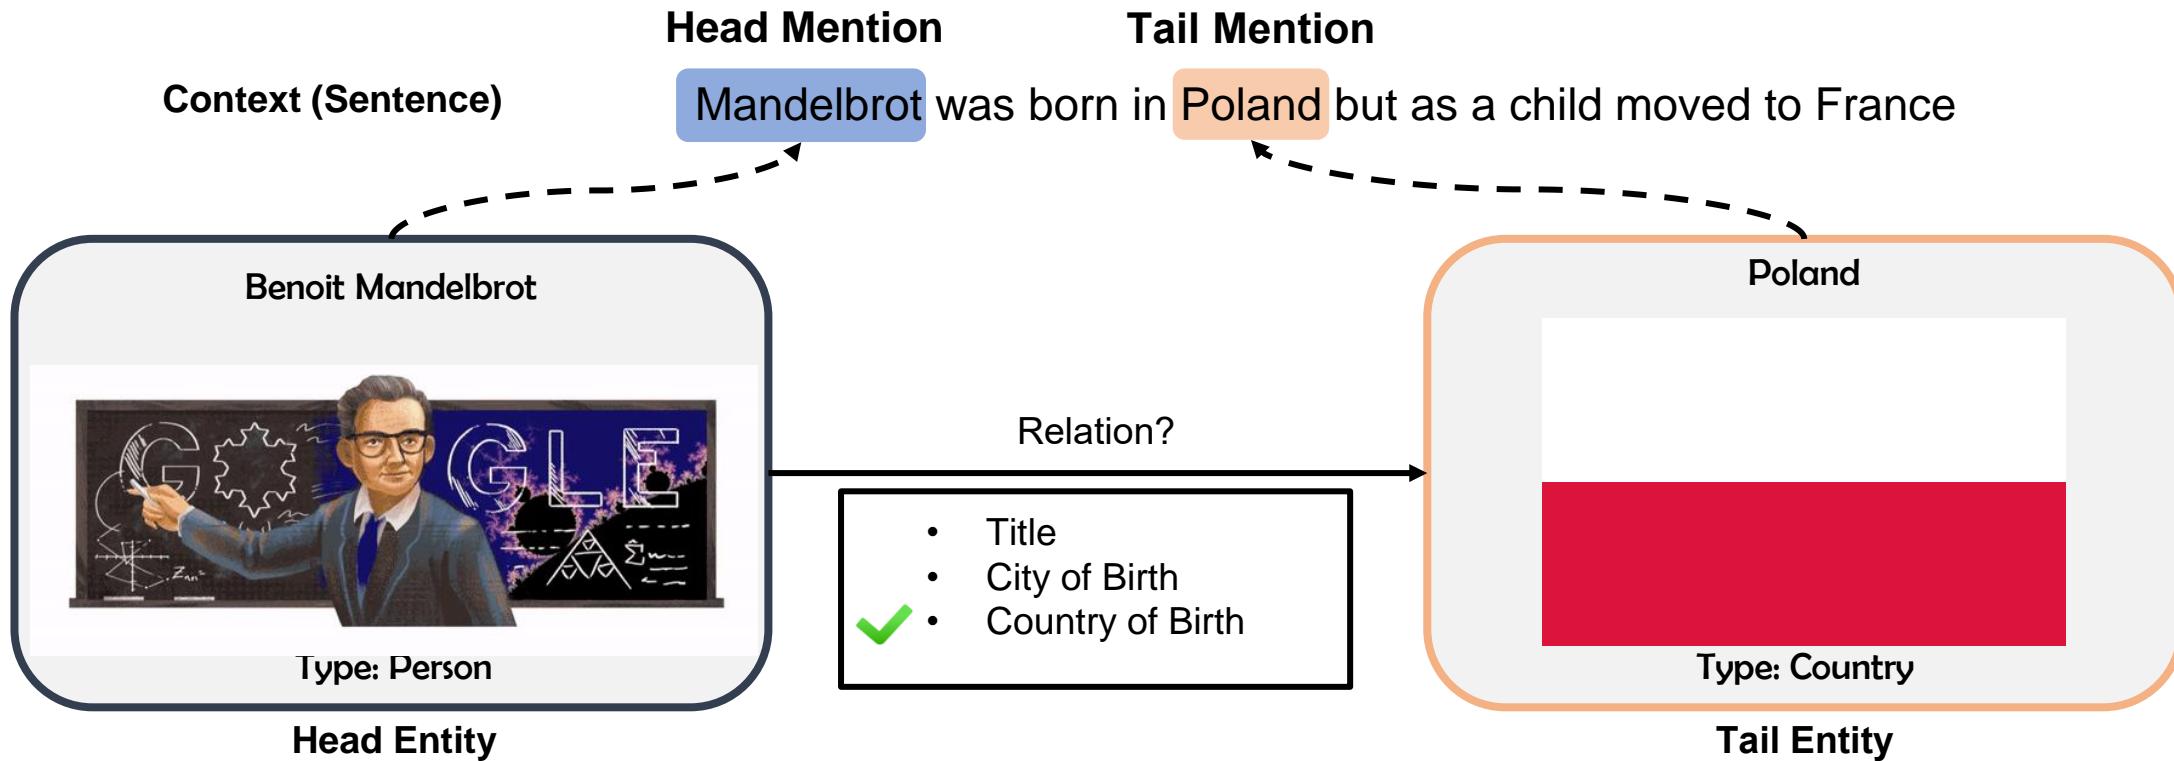

Can we transfer signals from a more resource-rich task?

An Exemplary Form of Indirect Supervision

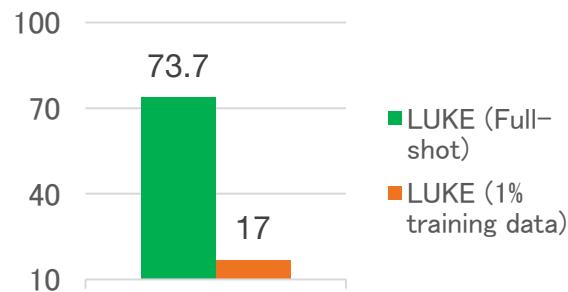

Summarization as Indirect Supervision

Take Relation Extraction As An Example

Formulated As Multi-class Classification

- Heavily relying on enough relation annotations

The model almost cannot generalize to rarely seen or unseen relations.

Indirect Supervision from Abstractive Summarization

Summarization: Generating concise expressions of **synoptical information** from the longer context

Document

Authorities said the incident took place on Sao Joao beach in Caparica, south-west of Lisbon.

The National Maritime Authority said **a middle-aged man and a young girl died** after they were unable to avoid the plane.

[6 sentences with 139 words are abbreviated from here.]

Other reports said the victims had been sunbathing **when the plane made its emergency landing**.

[Another 4 sentences with 67 words are abbreviated from here.]

Summarize
(seq2seq gen)

Summary

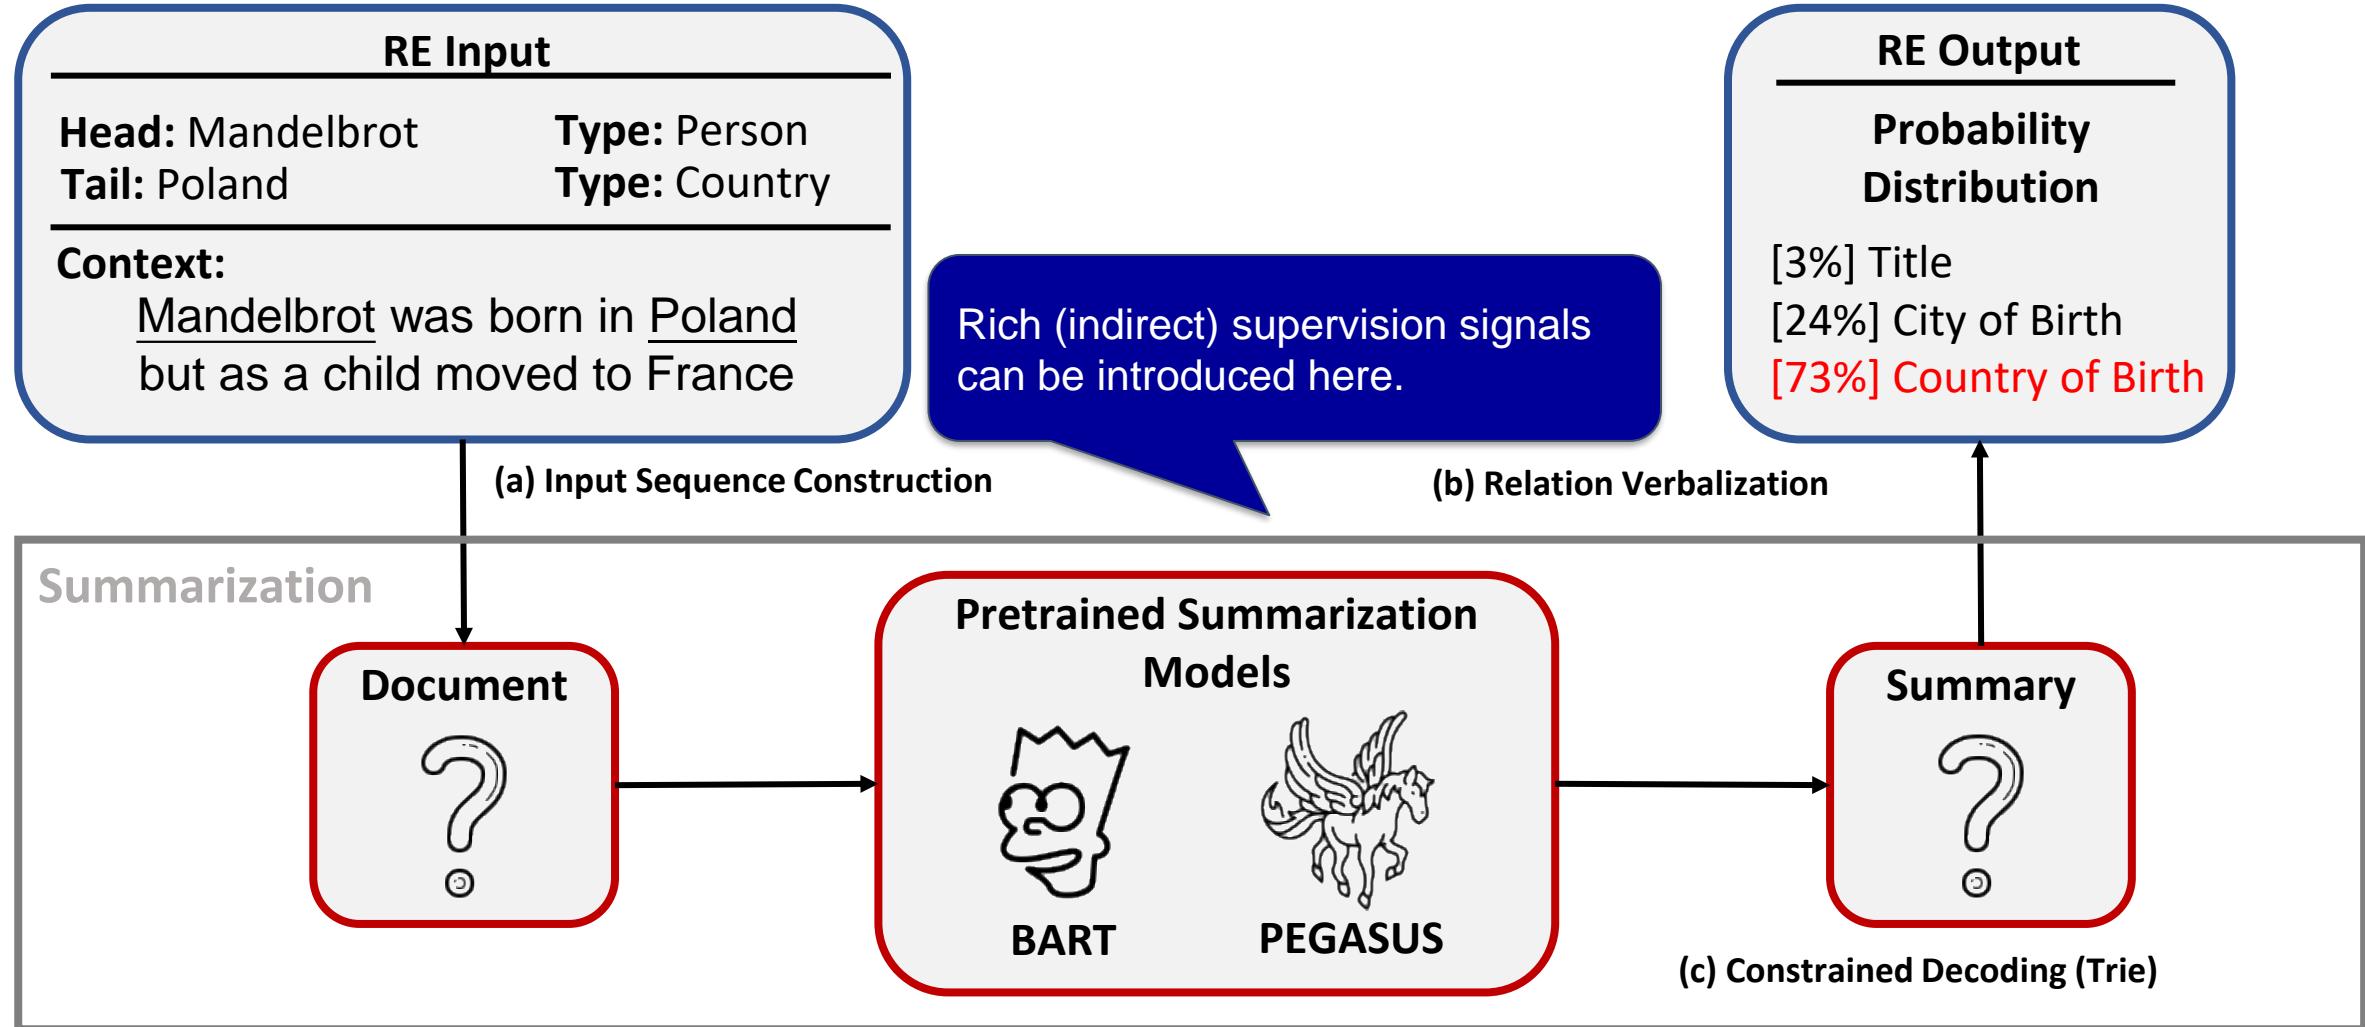

A man and a child have been killed after a light **aircraft made an emergency landing** on a beach in Portugal.

A more resource-rich task

- **Million-scale parallel summary corpora** (vs. a few hundred docs or <100k sentences for RE)
- More **easy-to-consume sources** (news summaries, paper abstracts, etc.)

Relation is just **one kind of synoptical information**.
Can we reformulate RE as summarization?

Reformulating RE as Summarization

Allowing supervision signals to be transferred from rich summarization resources (CNN/Daily Mail, XSUM) or pretrained models (BART-CNN, Pegasus).

Input Sequence Construction

- **Adding entity mentions and types:** hint the summarization model which entity pair is targeted for summarization.

Entity Information Verbalization

Input Sequence

The subject entity is Mandelbrot. The object entity is France. The type of Mandelbrot is person. The type of France is country.
Mandelbrot was born in Poland but as a child moved to France.

Relation Verbalization

- Simple template-based verbalization (using surface names of relations)

	Relations		Templates
r_1	title	T_1	{subj} is a {obj}
r_2	city of birth	T_2	{subj} was born in the city {obj}
r_3	country of birth	T_3	{subj} was born in the country {obj}
r_4	founded by	T_4	{subj} was founded by {obj}
r_5	NA	T_5	{subj} has no known relations to {obj}

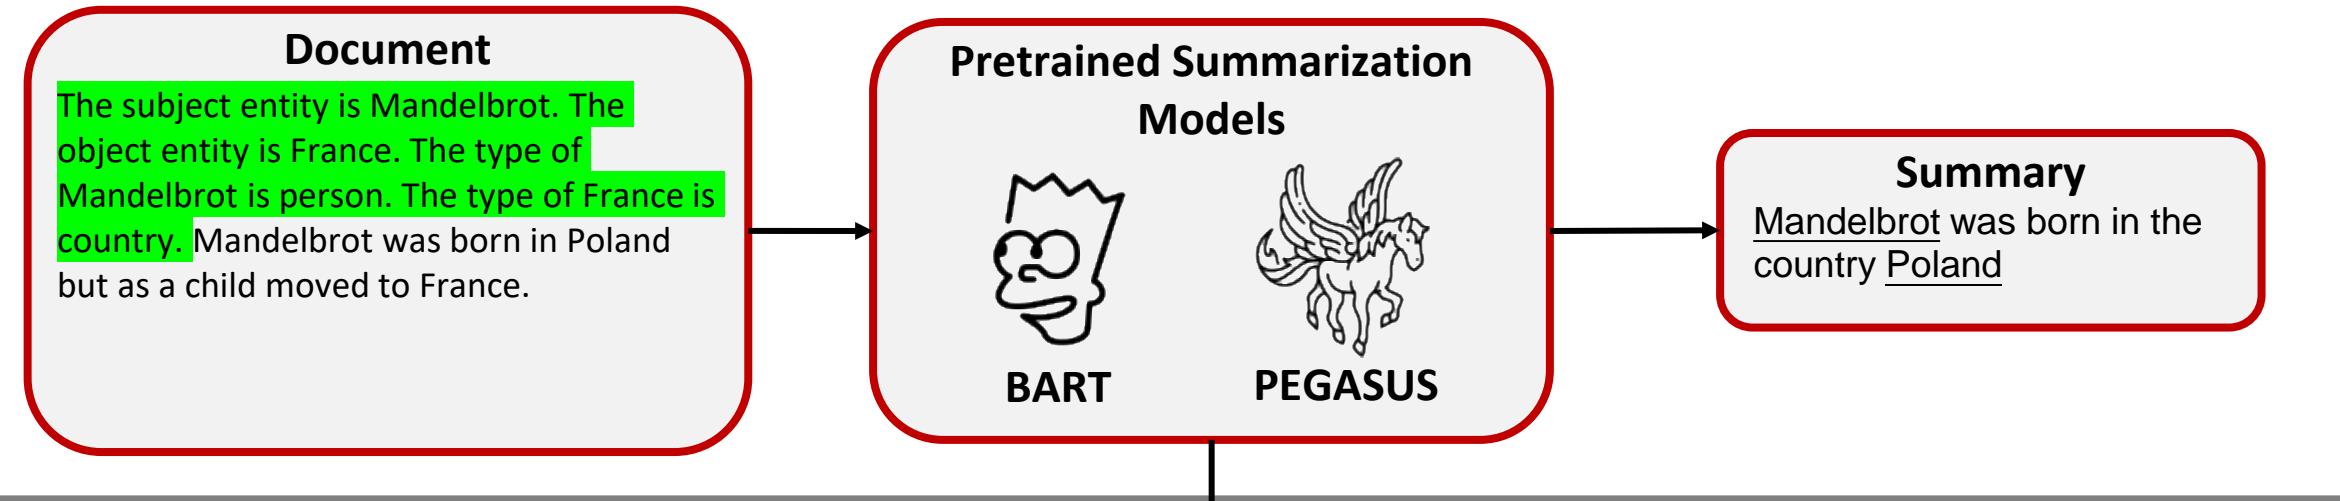

Verbalization

Both become natural language text that fits a summarization model.

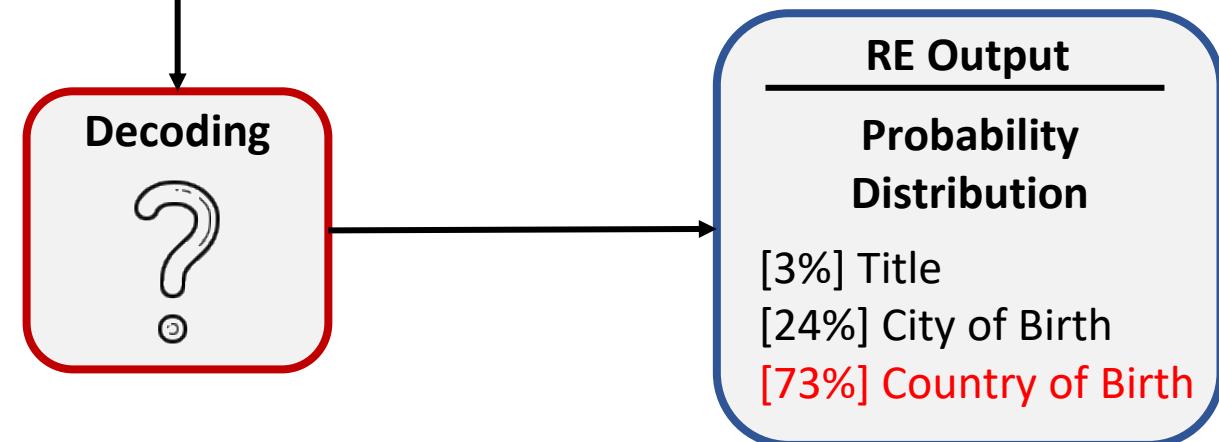

Relation Verbalization:

- r_1 : Mandelbrot is a Poland
- r_2 : Mandelbrot was born in the city Poland
- r_3 : Mandelbrot was born in the country Poland
- r_4 : Mandelbrot was founded by Poland
- r_5 : Mandelbrot has no known relations to Poland

Summarization (Training)

Inference: How to make sure the model only generates relation information?
(i.e. mappable to the decision space of RE)

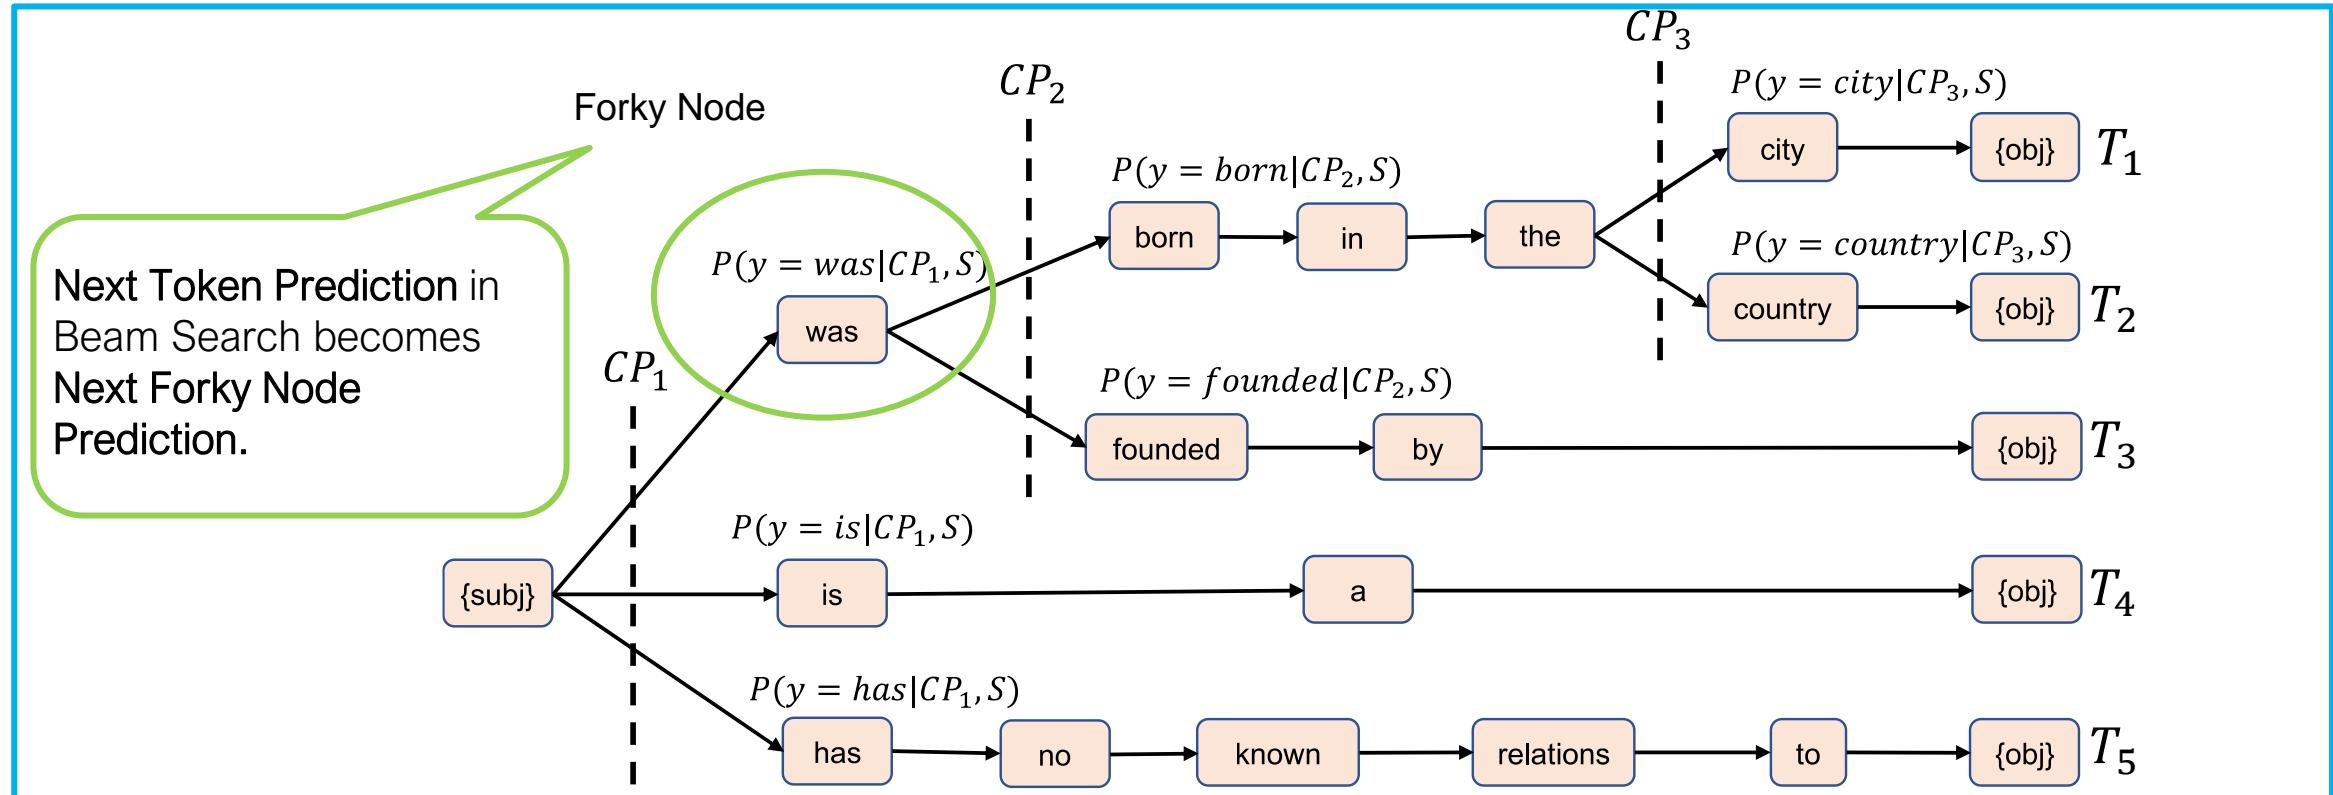

How to let the model summarize only relation-descriptive information?

Step 1. Build a Trie for relations

Step 2. Beam Search on the Trie

Step 3. Calculate accumulate scores

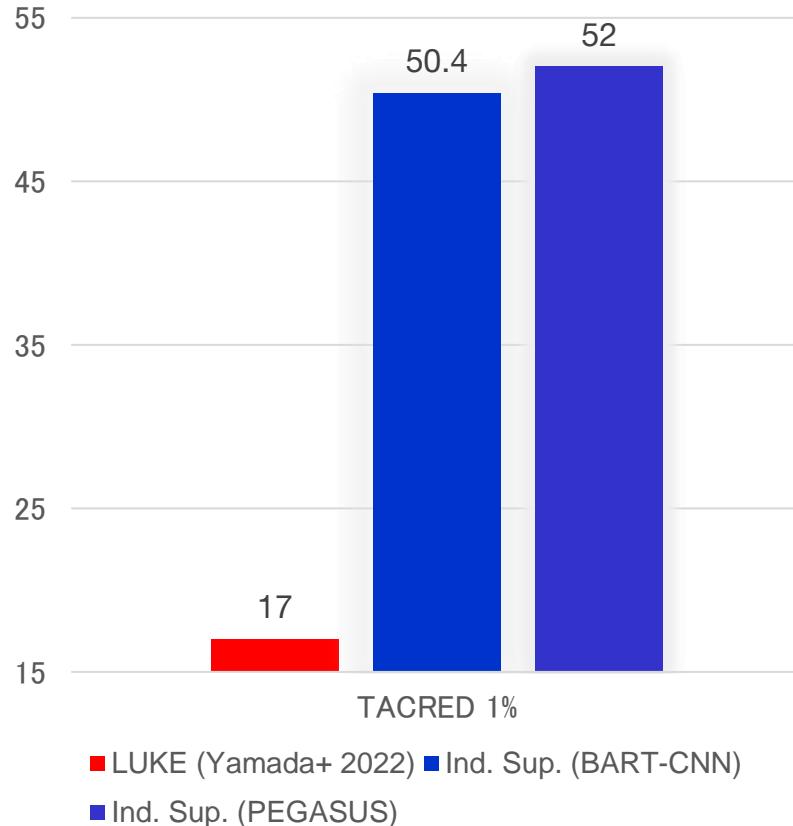

$$P(r_1) = P(y = \text{was}|CP_1, S)P(y = \text{born}|CP_2, S)P(y = \text{city}|CP_3, S)$$

$$P(r_2) = P(y = \text{was}|CP_1, S)P(y = \text{born}|CP_2, S)P(y = \text{country}|CP_3, S)$$

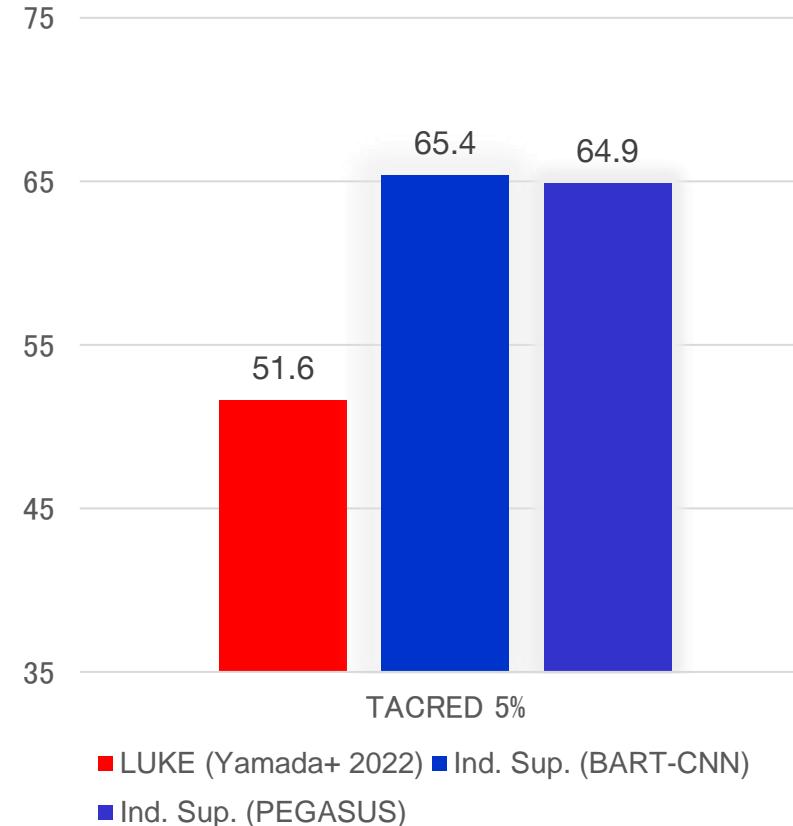

Summarization Results in Strong Indirect Supervision

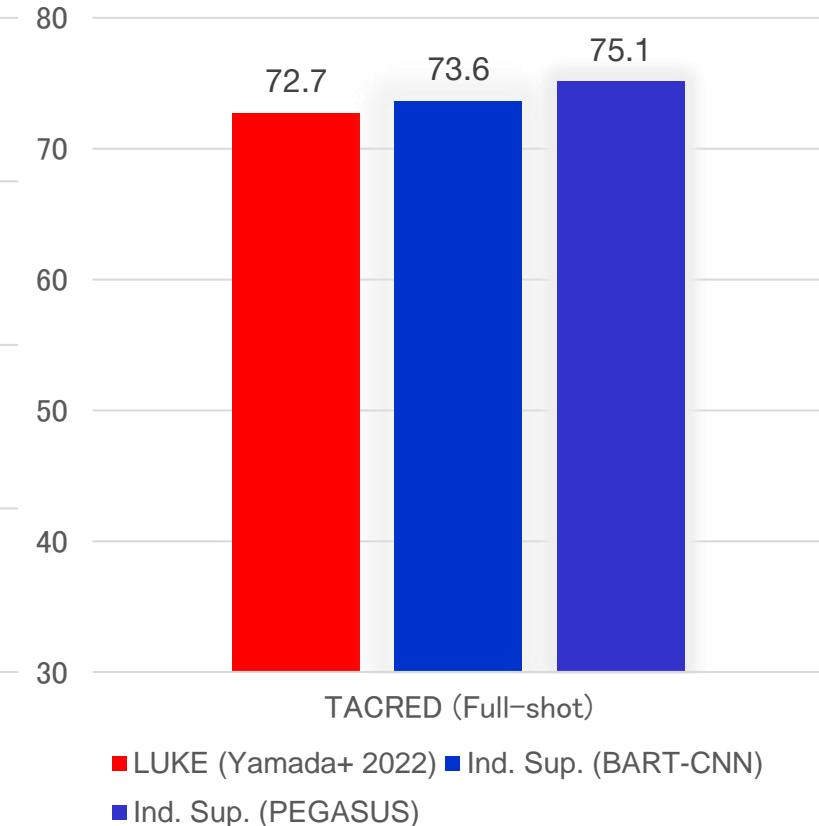

Few-shot (1%) RE on TACRED (F1)

Few-shot (5%) RE on TACRED (F1)

Full-shot RE on TACRED (F1)

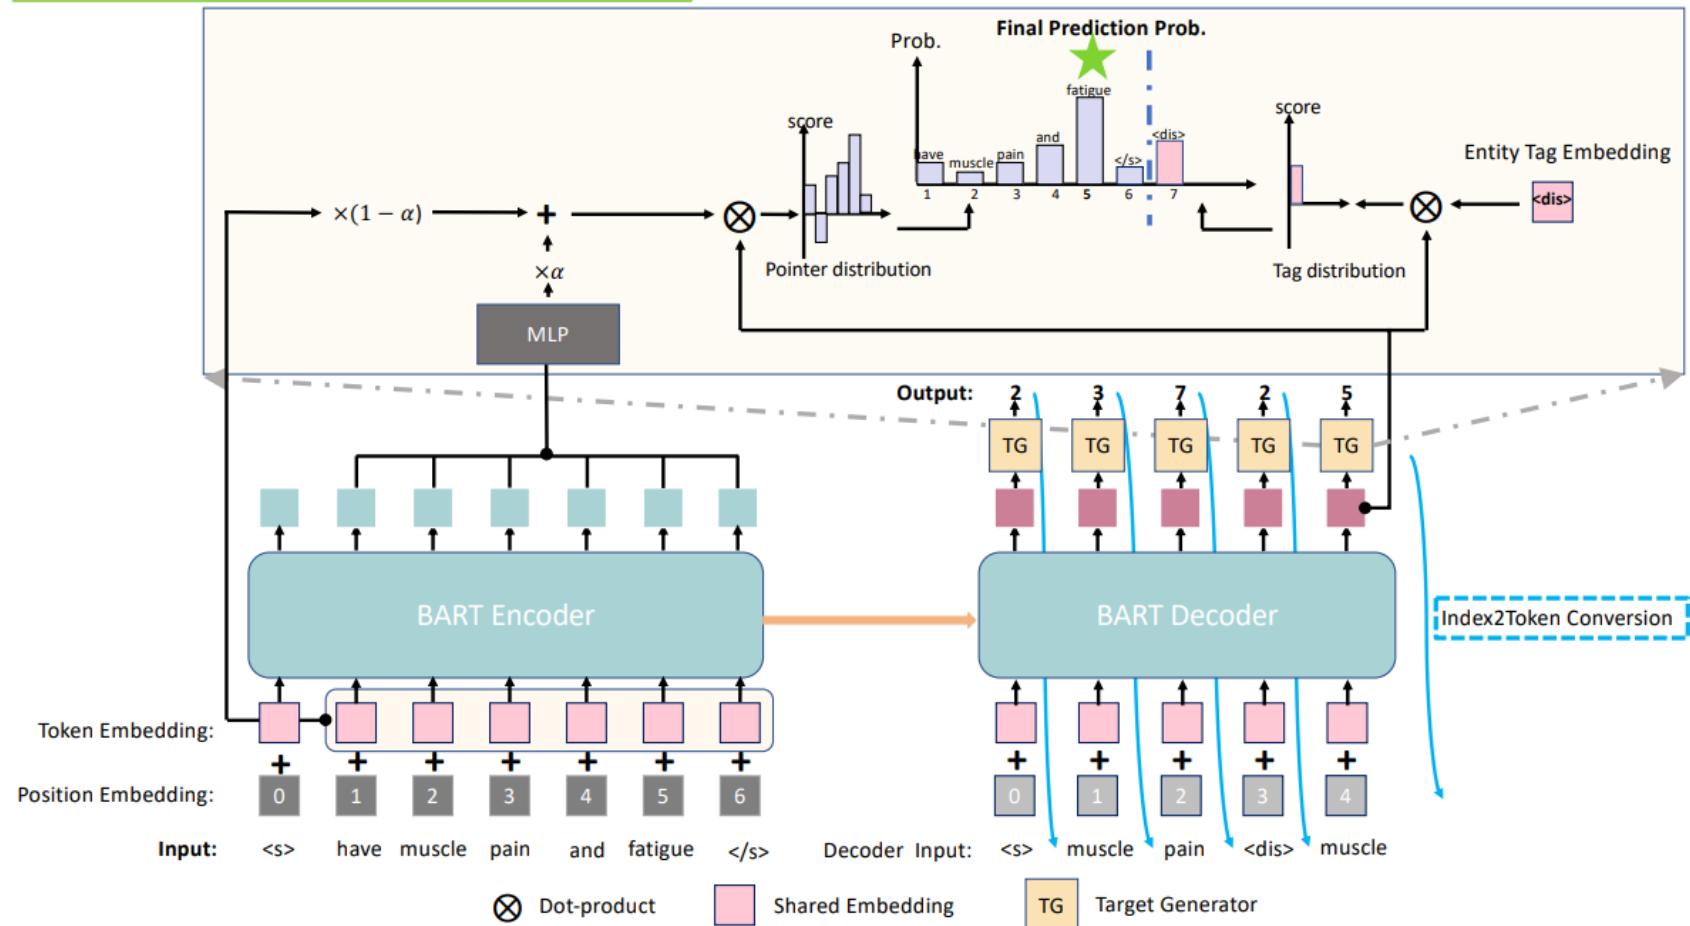

Summarization provides strong indirect supervision for low-resource relation extraction.

Also leads to precise full-shot relation extraction.

Generative NER

Input: <s> have muscle pain and fatigue </s>
Output: 2 3 7 2 5 6

Generative Event Extraction

Event extraction as a conditional generation problem

Event Trigger	<i>detonated</i>
Attacker	<i>Palestinian</i>
Target	<i>jeep, soldiers</i>
Instrument	<i>bomb</i>
Place	<i>Gaza Strip</i>

Decode the output sequence
into final predictions

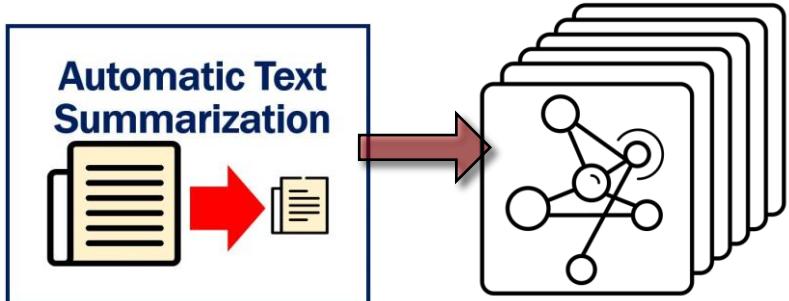

Autoregressive generation
considers dependencies

Output

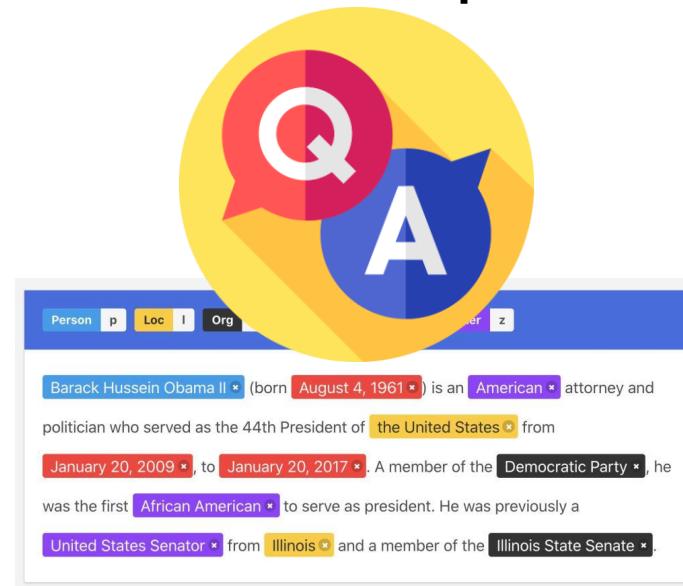

Generative Model

Earlier Monday , a 19-year-old *Palestinian* riding a bicycle *detonated* a 30-kilo (66-pound) *bomb* near a military *jeep* in the *Gaza Strip* , injuring three *soldiers*.

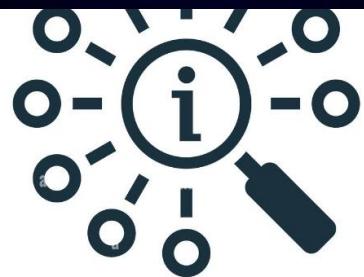

1. Constrained Generation as Indirect Supervision

2. QA as Indirect Supervision

3. IR as Indirect Supervision

Two Forms of QA as Generalizable Indirect Supervision

Extractive [SQuAD]

Question: At what speed did the turbine operate?

Context: (Nikola_Tesla) On his 50th birthday in 1906, Tesla demonstrated his 200 horsepower (150 kilowatts) 16,000 rpm bladeless turbine. ...

Gold answer: 16,000 rpm

Extractive QA

Supporting decisions inclusive to the input text

- Span detection (NER, Coref, etc.)
- Parsing (SRL, AMR, etc.)

Span or structural decisions.

Abstractive [NarrativeQA]

Question: What does a drink from narcissus's spring cause the drinker to do?

Context: Mercury has awakened Echo, who weeps for Narcissus, and states that a drink from Narcissus's spring causes the drinkers to "Grow dotingly enamored of themselves." ...

Gold answer: fall in love with themselves

Abstractive/Generative QA

Supporting any free-form decisions

- Relation extraction
- Dialogue
- Intent prediction
- etc.

Free-form decisions

Benefit 1: Handling nested entity mentions (not feasible for sequence tagging)

Last night, at ***the Chinese embassy in France***, there was a holiday atmosphere .

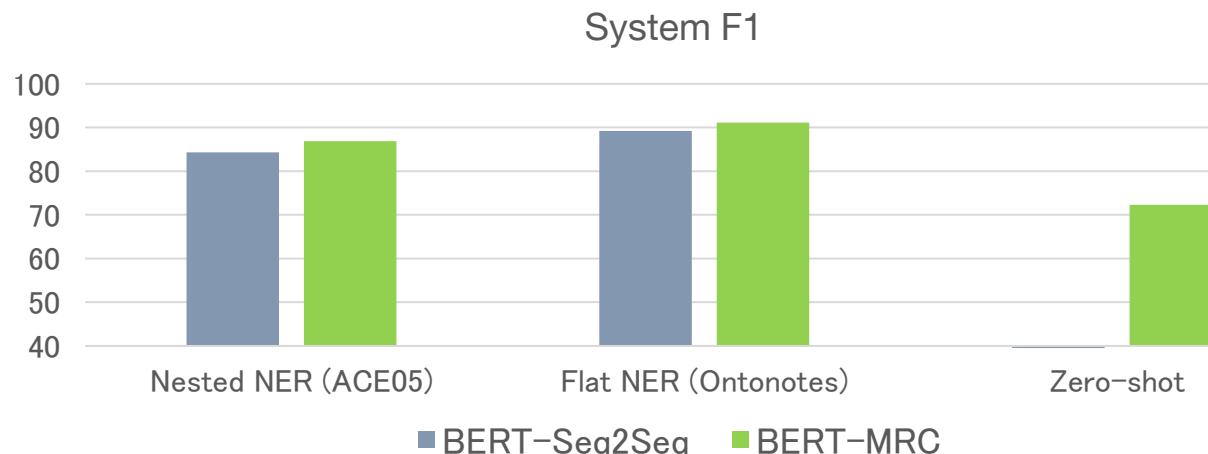

Find facilities in the text,
including buildings, airports,
highways and bridges.

Benefit 2: Questions serve as label definitions (Further improving generalization)

Entity	Natural Language Question
Location	Find locations in the text, including non-geographical locations, mountain ranges and bodies of water.
Facility	Find facilities in the text, including buildings, airports, highways and bridges.
Organization	Find organizations in the text, including companies, agencies and institutions.

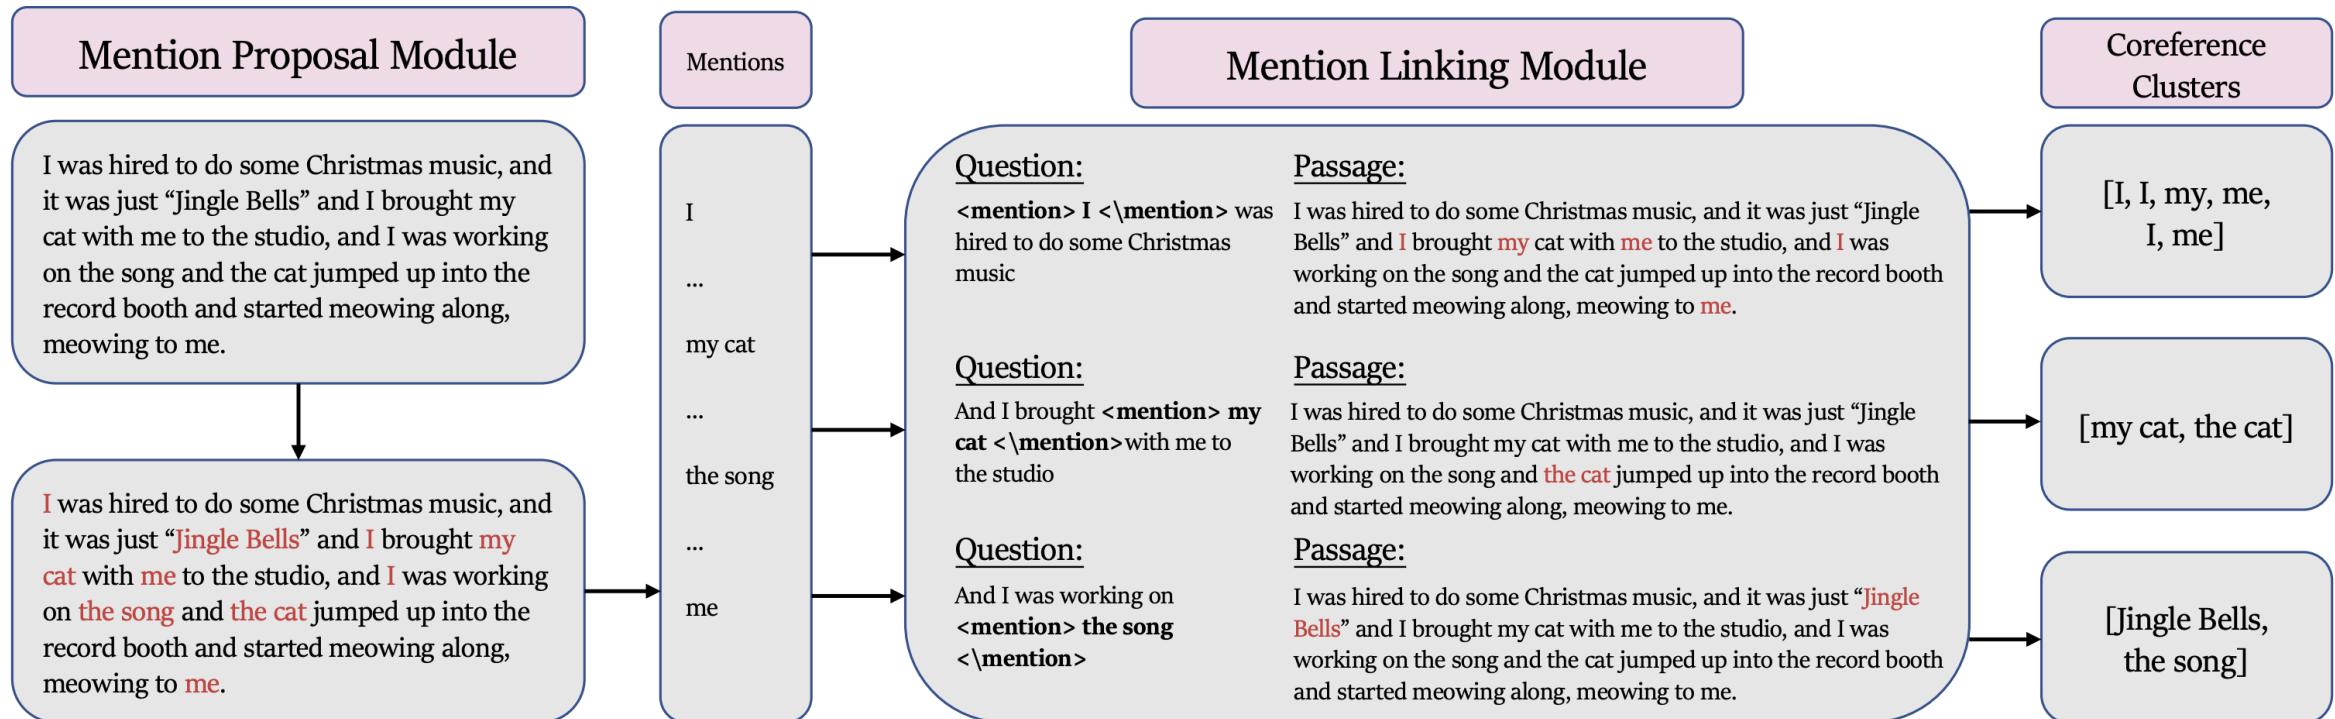

Better performance than seq2seq generation

Coreference Resolution as Extractive QA

Using the sentence that each mention is in as the “question”, all other spans belonging to the same cluster as “answers”

Other Tasks as Extractive QA

What did someone purchase?
Wade purchased Cunningham's home
Who purchased something?
in San Diego for over \$1.6M

Federal agencies are investigating Rep.
What did someone sell to someone?
Cunningham for **selling his house to**
Mitchell Wade
Who did someone sell something to?

The plane took off in Los Angeles. The tourists will **arrive in Mexico at noon**.

entity in motion	Who will arrive in Mexico?
end point	Where will the tourists arrive?
start point	Where will the tourists arrive from?
manner	How will the tourists arrive?
cause	Why will the tourists arrive?
temporal	When will the tourists arrive?

QA-SRL: QA as Semantic Role Labeling

Relation	Question	Sentence & Answers
<i>educated_at</i>	What is Albert Einstein 's alma mater?	Albert Einstein was awarded a PhD by the <u>University of Zürich</u> , with his dissertation titled...
<i>occupation</i>	What did Steve Jobs do for a living?	Steve Jobs was an American <u>businessman</u> , <u>inventor</u> , and <u>industrial designer</u> .
<i>spouse</i>	Who is Angela Merkel married to?	Angela Merkel 's second and current husband is quantum chemist and professor <u>Joachim Sauer</u> , who has largely...

QA for Relation Extraction

Advantages of Extractive QA for Information Extraction Tasks (over Seq2Seq Gen)

- Handling nested spans
- Questions can serve as task-oriented prompts and semantic representation of the label space

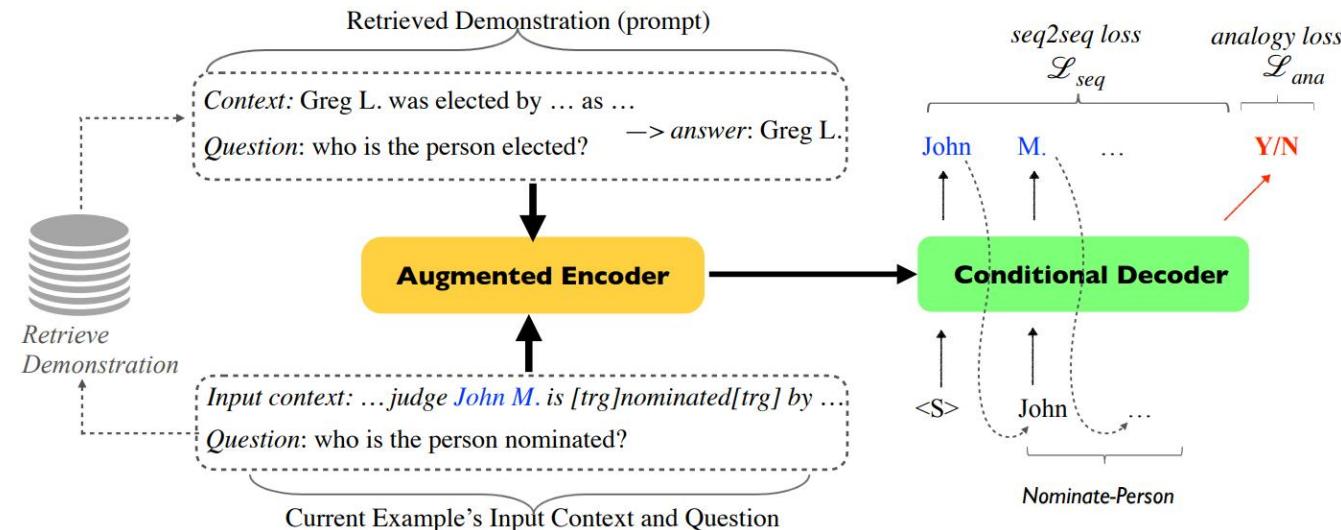

Benefits of An Abstractive QA Reformulation

- Supporting free-form, non-discriminative decision making
- Supporting multiple answers

Q: All possible intents from a user are [...], and slots could be [...]. A user said, “Look up directions to the nearest parking near S Beritania Street.” What did the user intend to do?

A: The user intended to get directions, where destination is nearest parking near S Beritania Street. The intent for “nearest parking near S Beritania Street” is to get location, where location’s category is parking and location modifiers are near S Beritania Street; nearest. The intent for “near S Beritania Street” is get location, where location is S Beritania Street and search radius is near.

Task-oriented Parsing (e.g., predicting user intent)

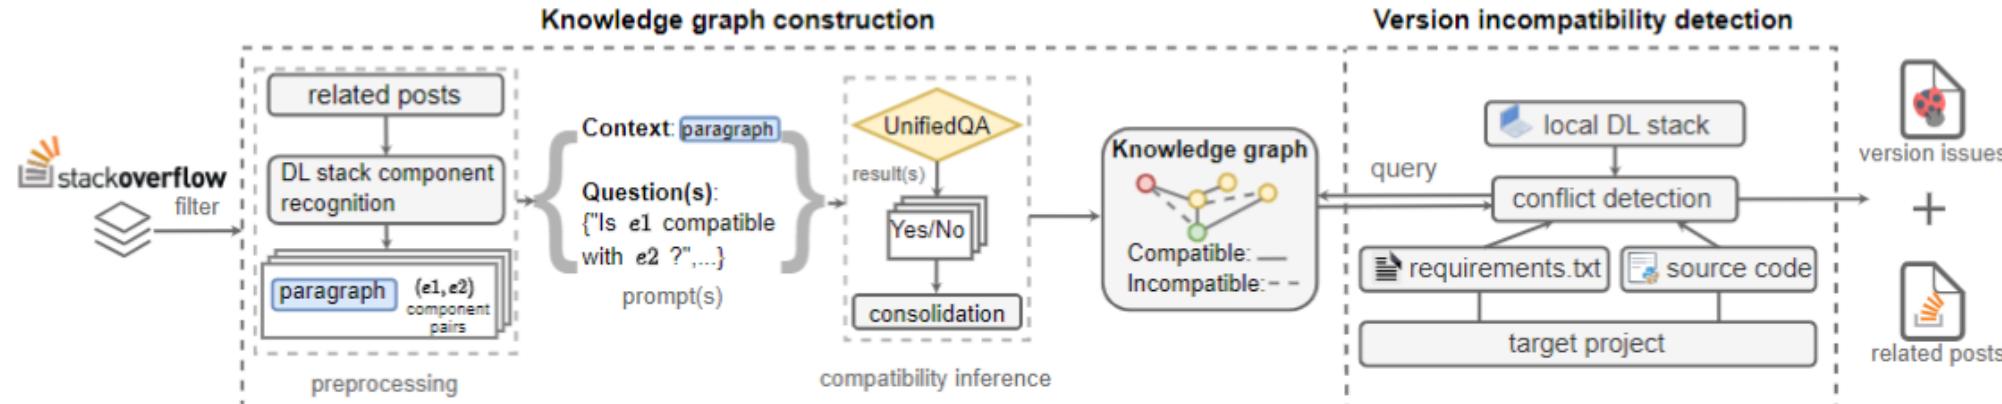

Event argument generation

Specialized Domain Application

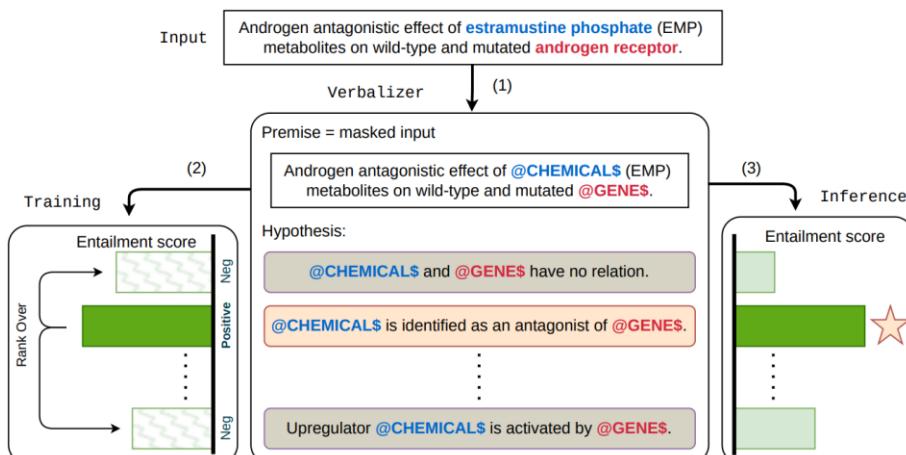

Generalizability and lack of annotations are more significant challenges here

QA for software version compatibility detection

Zhao et al. Knowledge-based Version Incompatibility Detection for Deep Learning. ESEC/FSE 2023

Extracting drug-drug interaction

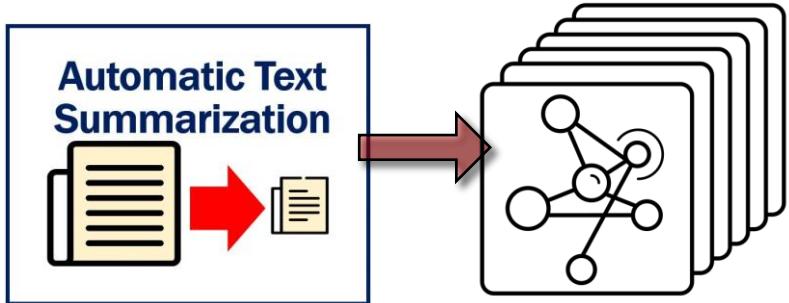

Xu et al. Can NLI Provide Proper Indirect Supervision for Low-resource Biomedical Relation Extraction? ACL 2023
Ma et al. DICE: Data-Efficient Clinical Event Extraction with Generative Models. ACL 2023

Clinical event extraction

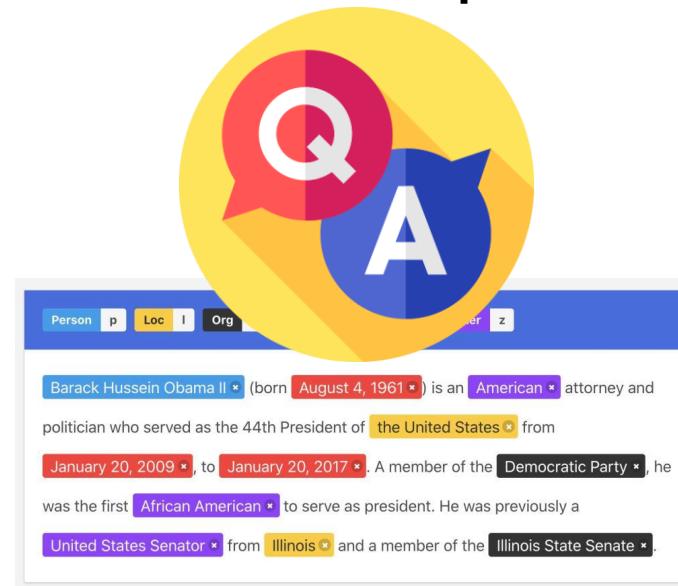

Sign_symptom
A man presented with an abnormal nodule measuring 0.8 x 1.5 cm in the left upper lung lobe imaged through chest computed tomography scanning.
Diagnostic_procedure

Event trigger	nodule
Event type	Sign_symptom
Detailed description	abnormal
Area	0.8 x 1.5 cm
Biological structure	left upper lung lobe

1. Constrained Generation as Indirect Supervision

2. QA as Indirect Supervision

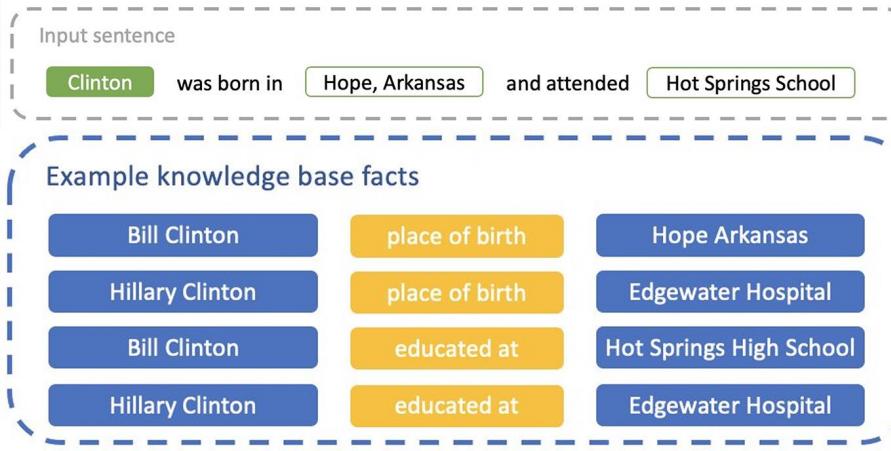

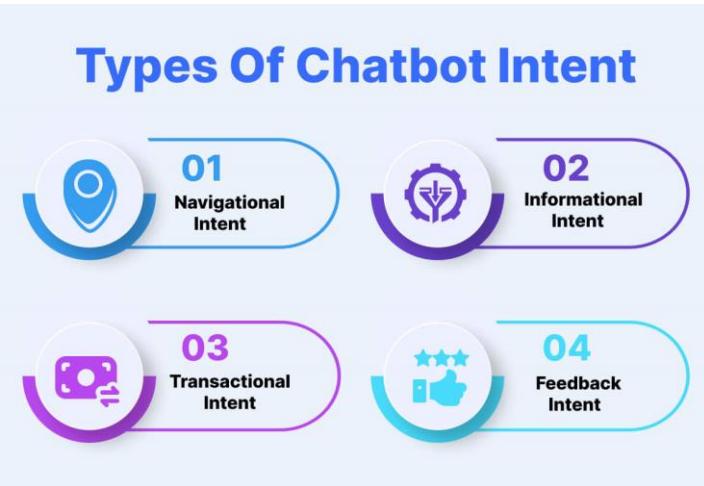

3. IR as Indirect Supervision

Dense Retrieval for NLU Tasks with Large Decision Spaces

Some NLU tasks may have very large decision spaces

The screenshot shows a Wikipedia article titled "Support-vector machine". The page content discusses SVMs as supervised learning models. It includes sections on development, methods, and classification. A red arrow points from the text "In addition to performing linear classification, SVMs can efficiently perform a non-linear classification using what is called the kernel trick, implicitly mapping their inputs into high-dimensional feature spaces." to the text "Tags: machine learning AI supervised learning".

Intent Detection

- Target: Hundreds of intent types

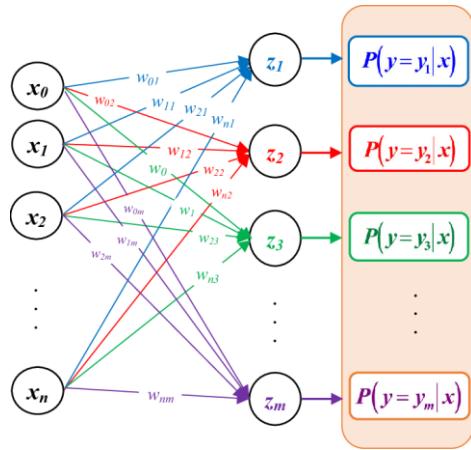

Entity Typing and Linking

- Target: entities in a whole KB

Extreme multi-label classification (XMLC)

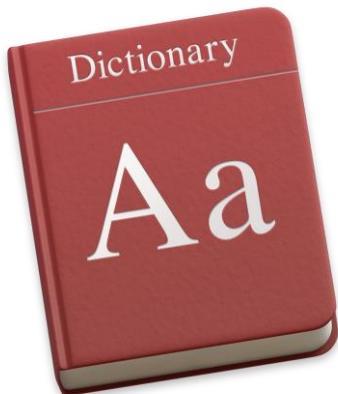

- Thousands to millions of tags

Large decision spaces in a hundred- to million-scale

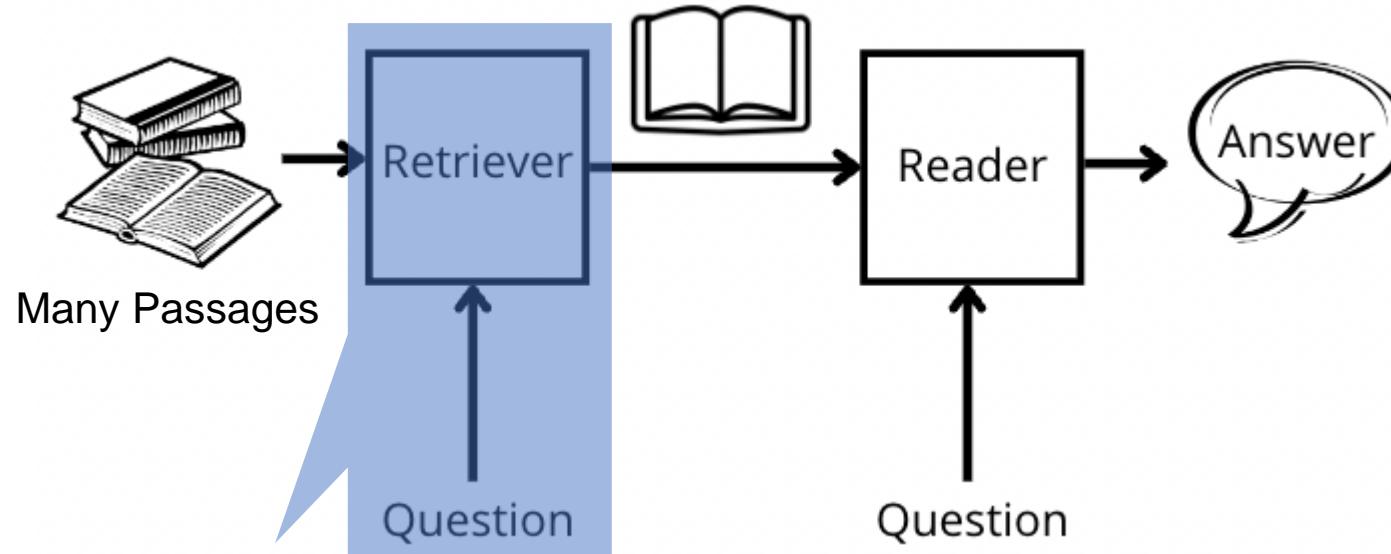

Supervising a classifier is not ideal

- Too few instances per class
- Meaningless class label representation
- Not generalizable to unseen classes

Learning to lookup a label thesaurus should be more feasible

- A plausible source of indirection supervision: Dense Retrievers
- Meaningful label representation
- Generalizes well to unseen labels

A dual-encoder model for retrieving passages most relevant to a question

- Two encoders \mathbf{P} and \mathbf{Q} for passages and questions
- Contrastive learning to maximize $\mathbf{P}^T \cdot \mathbf{Q}$ for correct question-passage pair
- Efficient (using MIPS) and generalizable retrieval

Passage

After bowling [Somerset]₃ out for 83 on the opening morning at [Grace Road]₂, [Leicestershire]₁ extended their first innings by 94 runs before being bowled out for 296 with [England]₁₁

The passage as query

$$Q = \text{enc}_Q([\text{CLS}] p [\text{SEP}] \psi(\text{topic}(x)))$$

Top- K candidate entities

- | | |
|----|--|
| 1. | Leicestershire County Cricket Club |
| 2. | Grace Road |
| 3. | Somerset County Cricket Club |
| x | 4. Durham County Cricket Club |
| x | 5. Nottinghamshire County Cricket Club |
| x | 6. Derbyshire County Cricket Club |
| x | 7. Warwickshire County Cricket Club |
| x | 8. Leicestershire |
| x | 9. Worcestershire County Cricket Club |
| x | 10. Yorkshire County Cricket Club |
| x | 11. England cricket team |
| x | 12. Marylebone Cricket Club |
| x | 13. Sussex County Cricket Club |
| x | 14. Kent County Cricket Club |
| x | 15. Leicester |
| x | 16. Aylestone Road |
| x | 17. County Cricket Ground, Derby |
| ⋮ | |

Entity candidates with descriptions

$$P = \text{enc}_P([\text{CLS}] \varphi \text{title}(e) \oplus \varphi \text{desc}(e) [\text{SEP}])$$

Reformulating entity linking into open-domain QA

1. The **retriever** finds top- K candidate entities mentioned in the passage
2. The **reader** extracts spans of each selected entity

A pre-existing inductive bias that helps retrieve the identities of entities

- 85.8 in-domain *micro* F_1 , and 60.5 out-of-domain F_1

Dense Retrieval for (Few-shot) Intent Prediction

"How long will it take for me to get my card?"

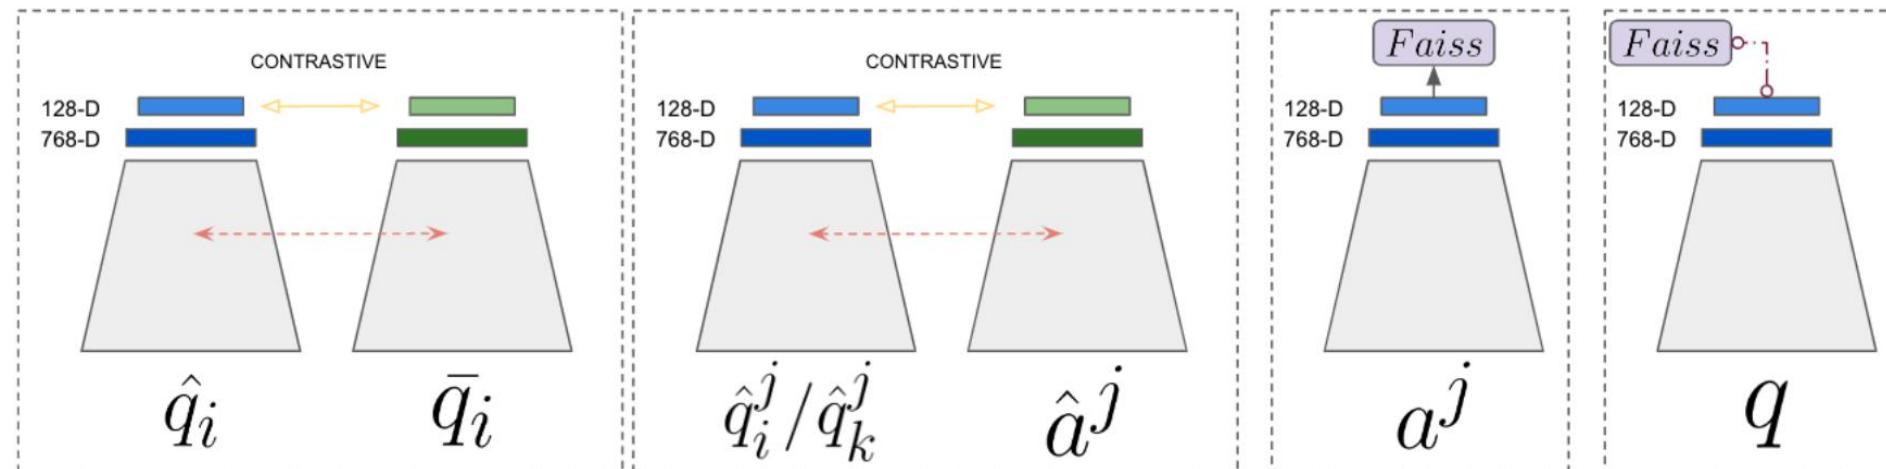

"Can you tell me how long it takes for a new card to come?"

"Can you tell me the status of my new card?"

"how many days processing new card?"

card_arrival
card_delivery_estimate
lost_or_stolen_card
contactless_not_working

(A) Self-Supervised Contrastive

(B) Supervised Contrastive

(C) Indexing

(D) Inference

↔ Shared
Weights/Activations

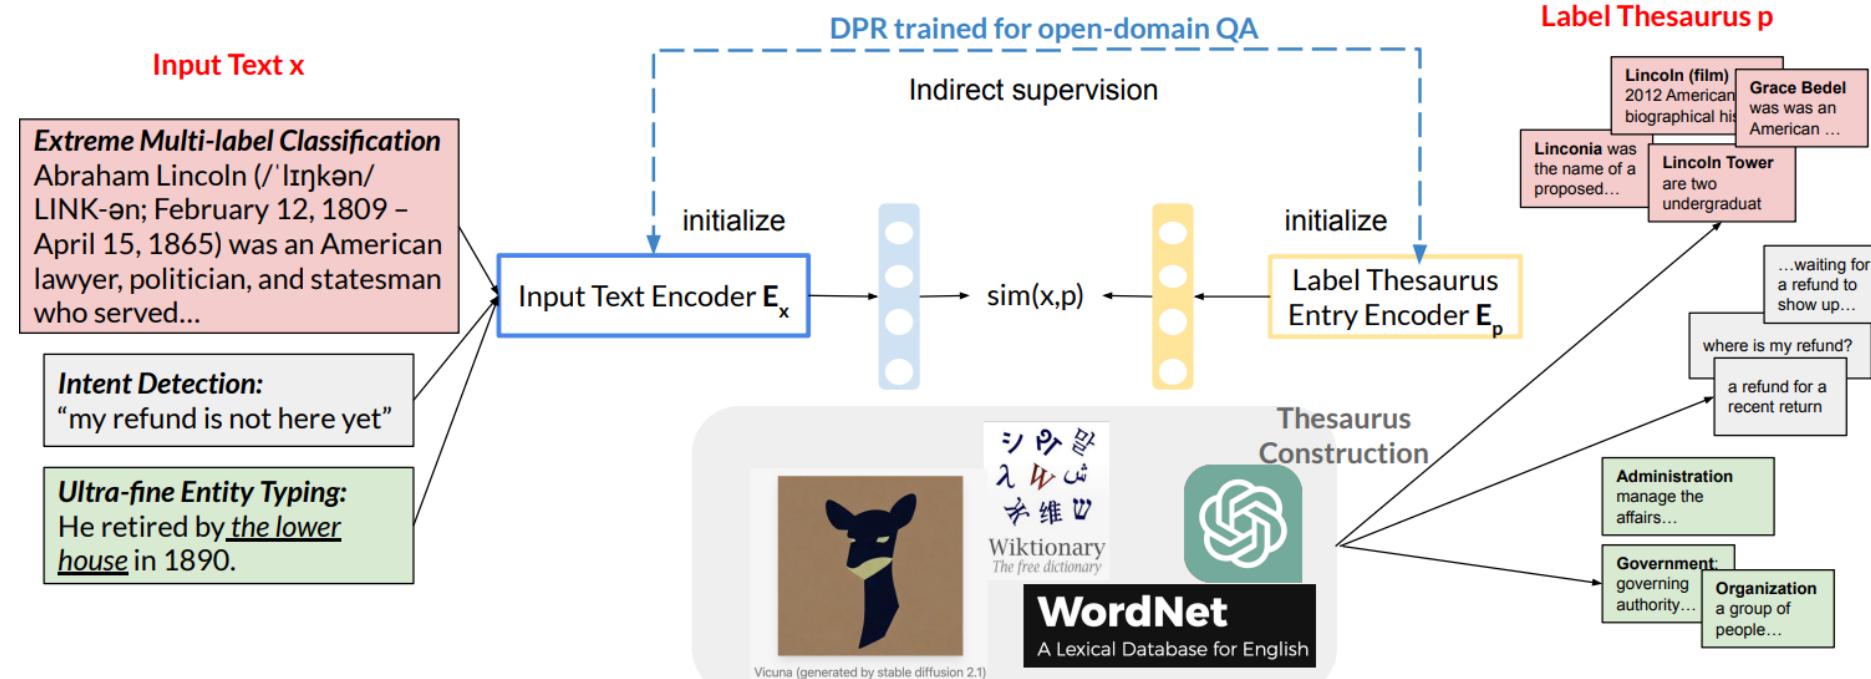

↔ Loss Function

○—○ Scoring and Prediction

Indirect supervision for retrieving from a fine-grained pool of intents

Enhancing few-shot generalizability (+5.22~8.50% in accuracy for 5-shot prediction)

Dense Retrieval as A General Solution

Dense retrieval from a **decision thesaurus** for any large-space decision making tasks

Ways of decision representation

- Lexical knowledge bases (WordNet, Wiktionary),
- LLM generated explanations
- Task training data

Retrieval tasks as a general form of indirect supervision

Dense Retrieval as A General Solution

Indirect Supervision Improves Three Large-space Decision Making Tasks

Input Text

The screenshot shows the Wikipedia page for "Abraham Lincoln". It includes a portrait of Lincoln, a summary of his life, and a section about his birthplace in Indiana.

Label Thesaurus Entry

The screenshot shows the Wikipedia page for "Grace Bedell". It includes a portrait of her and a section about her correspondence with Abraham Lincoln.

The screenshot shows the Wikipedia page for "The Towers (Ohio State)". It includes a photograph of the towers and a brief description of their location.

The screenshot shows the Wikipedia page for "Lincoln (film)". It includes a portrait of Lincoln from the movie and a brief description of the film.

① Extreme Multi-label Classification (XMC)

Method	Precision			Recall		
	@1	@3	@5	@1	@3	@5
MACLR	20.99	15.57	12.26	12.59	23.94	29.41
DDR	27.78	19.98	15.66	15.03	28.87	35.47

② Ultra-fine Semantic Typing

If Clinton maintains his lead in the polls, **he** will be the first Democrat since Franklin D. Roosevelt to be elected to a second full term .

politician
a leader engaged in civil administration

Label Thesaurus Entry

person
a human being

campaigner
a politician who is running for public office

Method	Precision	Recall	F1
Context-TE	53.7	49.4	51.5
DDR	51.9	52.3	52.1

+③ Few-shot Intent Detection

Pros and Cons of Different IS Sources
